Coreso welcomes the creation of permanent Security Panel and IT Platform in Central-Eastern Europe.

The company Coreso (Coordination of Electricity System Operators), the first regional technical coordination center for operating electricity networks in Central Western Europe, welcomes the creation by eleven Transmission System Operators of a permanent security panel and IT platform for data exchange in Central Eastern area in Europe.

The emergence of such a platform for TSO cooperation in the Central Eastern part of Europe, pursuing the same goal of enhancement of the security and cooperation between TSOs as Coreso, is the demonstration of the commitment of TSOs to ensuring a reliable and sustainable electricity supply all over Europe.

Data exchange and sharing security assessment results are the first step towards better coordination and management of the the flows on the grids and to the enhancement of security of the system.

The contacts that have been existing for several months with TSOs involved in this new project make us confident about the complementarity of the two initiatives, and the quality of data provided by the TSOs in Europe.

Coreso is delighted about the close cooperation with its colleagues and possible synergies, additional guarantees for a securest management of the electrical flows between these two parts of Europe.
